

GENOMICA Y PROTEOMICA COMPUTACIONAL

Práctica 11: Metagenómica (USEARCH)

Dr. Frank Solano

Metagenómica

- El estudio del ADN de los microorganismos no cultivados
- Genoma: la información genética de un solo organismo
- Metagenoma: la información genética de un conjunto de organismos
 - Suelos, aguas, costa, aire, huesos antiguos, muestras asociadas a un huésped, etc.

Genes para enzimas que degradan polisacáridos (biocombustibles)

Metagenómica

- Objetivo: entender la composición y operación de un consorcio complejo de microorganismos en una muestra ambiental por medio de la secuenciación y análisis de su ADN
- Metatranscriptómica y metaproteómica:
 - El blanco es el ARN y las proteínas obtenidas de esas muestras.
- Avances en la NGS aumentan el número y el alcance de los proyectos de secuenciación ambiental

Metagenómica: preguntas bioinformáticas

- Quienes están ahí?

ABSTRACT

Background. VSEARCH is an open source and free of charge multithreaded 64-bit tool for processing and preparing metagenomics, genomics and population genomics nucleotide sequence data. It is designed as an alternative to the widely used USEARCH tool (*Edgar, 2010*) for which the source code is not publicly available, algorithm details are only rudimentarily described, and only a memory-confined 32-bit version is freely available for academic use.

SSU Ref NR (non-redundant)

Why a non-redundant version of the SILVA SSU Ref database?

For users interested in representative (rRNA) sequence collections, the rapid growth of the data sets has led to immense hardware requirements paired with a significantly increased amount of time to analyse the data. In case of large databases such as the current rRNA data sets, ARB especially requires large amounts of main memory (RAM) to be able to load the database (see also box below).

Basically, there are two options to face this problem: (1) a hardware upgrade to provide the amount of RAM required or (2) a reduction of the number of sequences in the ARB database to bring the RAM requirements down to the current hardware specifications.

For multiple reasons, the second option should be preferred as long as the resulting data set still is "representative" - a very important parameter in environmental microbiology. Therefore, the SILVA project has addressed this task, resulting in a "non-redundant" (NR) SSU Ref dataset build by a dereplication of the full SSU Ref using a 99% identity criterion.

As of SILVA release 119 the SSU Ref NR is the only SSU dataset with a manual curated guide tree. SSU Ref is still provided as an ARB dataset but without the guide tree.

Welcome to the SILVA rRNA database project

A comprehensive on-line resource for quality checked and aligned ribosomal RNA sequence data.

SILVA provides comprehensive, quality checked and regularly updated datasets of aligned small (16S/18S, SSU) and large subunit (23S/28S, LSU) ribosomal RNA (rRNA) sequences for all three domains of life (*Bacteria*, *Archaea* and *Eukarya*).

SILVA are the official databases of the software package ARB.

RDP Release 11, Update 5 :: September 30, 2016

3,356,809 16S rRNAs :: 125,525 Fungal 28S rRNAs
Find out what's new in RDP Release 11.5 [here](#).

Cite RDP's latest tool articles.

RDP provides quality-controlled, aligned and annotated Bacterial and Archaeal 16S rRNA sequences, and Fungal 28S rRNA sequences, and a suite of analysis tools to the scientific community. New to RDP release 11:

- RDP tools have been updated to work with the new fungal 28S rRNA sequence collection.
- A new Fungal 28S Aligner and updated Bacterial and Archaeal 16S Aligner. We optimized the parameters for these secondary-structure based Infernal aligners to provide improved handling for partial sequences.
- Updated RDPipeline offers extended processing and analysis tools to process high-throughput sequencing data, including single-strand and paired-end reads.
- Most of the RDP tools are now available as open source packages for users to incorporate in their local workflow.

Metagenómica

- Bases de datos: cual usar?

Use a small database with authoritative classifications

I recommend using a authoritatively classified sequences, e.g. for 16S the most recent RDP training set or LTP release.

Taxonomy annotations in large databases are **unreliable predictions**

The taxonomy annotations in the large 16S databases (SILVA, Greengenes, or the full RDP database) are mostly computational predictions from 16S sequences. Roughly one in five of these predictions are wrong, probably because the guide trees have pervasive branching order errors. Therefore, using annotations from large databases adds a substantial error rate in the reference dataset on top of the intrinsic error rate of a prediction algorithm such as SINTAX or the Naive Bayesian Classifier. With these considerations in mind, I believe it is best to use a database of type strain and isolate sequences rather than Greengenes, SILVA or RDP.

Name	Submitting Centre	Organism
koala metagenome		koala metagenome

Secondary accession(s)

SRP049712

Description

We describe the microbiome composition of different body regions of two captive koalas: the eye and digestion associated organs, such as mouth and gut through both rectal swabs and feces. We want to establish a baseline for the microbiome of healthy koala eyes, since koalas frequently suffer from ocular infections caused by the highly prevalent Chlamydia. We want also to determine whether digestion associated bacterial communities are unusual in koalas given their special diet of Eucalyptus leaves. Furthermore we compare rectal swabs and feces as alternative samples to describe gut microbial diversity and investigate whether captivity can influence koala gut microbiome by comparison with data from wild koalas.

Metagenómica

- Metodología

- Universal primers 27F (5'-AGAGTTTGATCCTGGCTCAG-3') and 338R (5'-TGCTGCCTCCCGTAGGAGT-3')⁵³ were used for PCR amplification of the V1–V2 hypervariable regions of the bacterial 16S rRNA gene.
- The libraries were first amplified in a 50 µl volume reaction using 5 µl of DNA library, 0.5 µl Herculase II Fusion DNA Polymerase (Agilent Technologies Inc.), 10 µl Herculase II Reaction Buffer (5x), 0.5 µl dNTPs (25 mM), 1 µl Single Index Primer P5 (10 µM), 1 µl Illumina Index Primer P7 (10 µM) and sterile distilled water to volume. A unique P7 Index Primer was used for each library to allow for subsequent sample discrimination after the sequencing of pooled libraries.
- The indexed DNA libraries were then pooled at equimolar concentrations for paired-end sequencing (2 × 250) on an Illumina MiSeq v2 platform at the Danish National High-Throughput DNA Sequencing Centre in Copenhagen, Denmark.

Introduction

In [SSU metagenomics](#), next-generation reads are clustered into [Operational Taxonomic Units](#) (OTUs). This requires [quality filtering](#), [dereplication](#), [discarding singletons](#) (optional), and finally clustering into OTUs, typically at a 97% identity threshold.

Benchmark results

The [OTU benchmark](#) uses 454 Titanium and Illumina MiSeq reads of Even and Staggered mock communities used for protocol development in the [Human Microbiome Project \(HMP\)](#). USEARCH results were obtained with the same parameters for all samples. The number of reads per sample ranges from 10,000 (Titanium) to two million (MiSeq). The accuracy of [UPARSE](#) was compared to recommended procedures (Sept. 2012) for mothur, QIIME and AmpliconNoise.

• USEARCH

Read preparation

Assemble paired reads, quality filter,
trim lengths, find unique sequences

Read preparation

See also

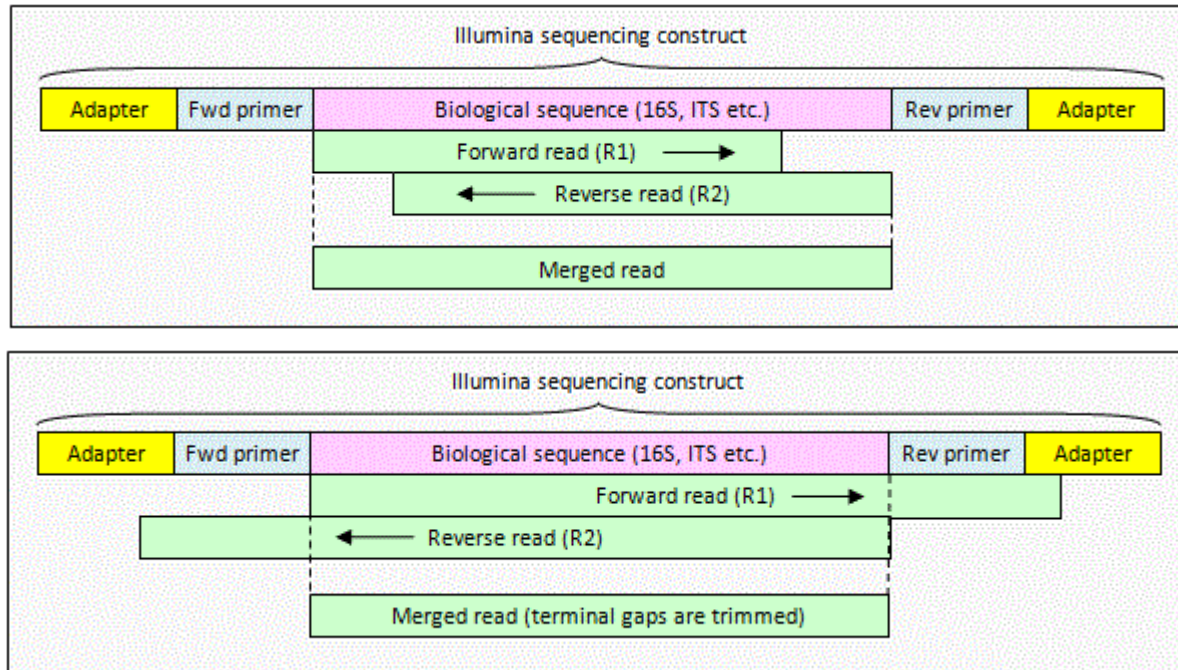

[OTU / denoising pipeline](#)

The table below summarizes the read preparation steps that I recommend for an OTU / denoising pipeline. Follow the links for details.

	Step	Description
	Understand your reads	Investigate your reads, don't blindly follow a recipe
1	Demultiplex	Assign reads to samples using index reads or barcodes
	Merge pairs	Merge paired reads to get consensus sequences and Q scores
3	Strip primers	Primer-binding sequence should be removed before quality filtering
2	Orient	If you have reads on both strands, orient before trimming and finding uniques
3	Strip machine sequences	Remove machine-specific sequences e.g. TCAG for 454
4	Length trimming	Remove low-quality tails, make sure 3' ends align
5	Quality filtering	Making OTUs (but not the OTU table) needs high-quality reads
	Pool samples	Reads for all samples should be combined
6	Discard singletons	Remove low-abundance reads, which often have errors

Metagenómica

- USEARCH

The non-biological sequence will be deleted automatically because fastq_mergepairs detects staggered alignments and deletes terminal gaps before building a consensus sequence.

Metagenómica

- USEARCH Paso A: preparación de las lecturas
- 1. Unir lecturas R1 y R2: `usearch -fastq_mergepairs`
- 2. Orientar secuencias: `usearch -orient`
- 3. Eliminar secuencias de primers: `usearch -fastx_truncate`
- 4. Filtrar por longitud y calidad: `usearch -fastq_filter`
- 6. Dereplicar: `usearch -fastx_uniques`

Singletons

Definition of a singleton

A singleton is a read with a sequence that is present exactly once, i.e. is unique among the reads.

- USEARCH Paso B: Generar OTUs y tabla de OTUs
- 7. Generar OTUs: `usearch -cluster_otus`
- 8. Crear tabla de OTUs: `usearch -otutab`
- 9. Normalizar la tabla de OTUs: `usearch -otutab_norm`
- 10. Eliminar OTUs poco representativos: `usearch -otutab_trim`

Clustering and chimera filtering

Asignar lecturas a OTU (OTU table)

#OTU	ID	F3D0	F3D141	F3D142	F3D143	F3D144	F3D145	F3D146	F3D147
OTU_6		749	535	313	372	607	849	493	2025
OTU_25		29	57	14	2	14	22	16	127
OTU_1		613	497	312	247	472	719	349	1720
OTU_8		426	378	255	237	382	627	330	1417
OTU_31		149	38	10	19	25	21	43	31
OTU_2		366	392	327	185	313	542	248	1367
OTU_7		196	370	92	107	48	155	74	105
OTU_10		46	169	87	109	171	209	120	864
OTU_80		26	6	0	1	4	8	18	11

Metagenómica

- USEARCH Paso C: Control de calidad de los OTUs
- 11. Alinear OTUs a base de datos: `usearch -usearch_global`
- 12. Verificar longitud de los OTUs: `usearch -fastx_info`
- 13. Verificar orientacion de los OTUs: `usearch -orient`
- 14. Filtrar OTUs de baja complejidad: `usearch -filter_lowc`
- 15. Filtrar secuencias PhiX en OTUs: `usearch -search_phix`

Metagenómica

- USEARCH
- Control de calidad de los OTUs obtenidos

Issue	Description
-------	-------------

Alignments	Do the OTU sequences align well to a reference database for your gene?
Missing OTUs	Do all OTUs appear in the OTU table?
Coverage	How much of the data is explained by the OTUs?
Short constructs	Bad sequencing construct created by PCR
Strand duplicates	Sequences of both plus and minus strands
Offsets	Sequences start at different positions in the gene
Cross-talk	Reads assigned to the wrong sample.
Sequence error	Polymerase errors and bad base calls
Low complexity	Sequencer noise
PhiX	Unfiltered spike-in
Chimeras	Unfiltered PCR chimeras
Mistargeting	Primers amplify a different region
Contaminants	Self-explanatory
Primers	Primer-binding sequences should be stripped at the start of the pipeline
Tight OTUs	OTUs >97% identical

Metagenómica

- USEARCH Paso D: Análisis de diversidad
- 16. Alpha diversidad: `usearch -alpha_div`
- 17. Rarefaccion: `usearch -alpha_div_rare`
- 18. Beta diversidad: `usearch -beta_div`

Metagenómica

- USEARCH
- Estimating microbial diversity
 - Diversidad alfa: The diversity in a single sample (alpha diversity) is commonly measured using metrics such as the Shannon index and the Chao1 estimator
 - Diversidad beta: The variation between pairs of samples (beta diversity) is measured using metrics such as the Jaccard distance or Bray-Curtis dissimilarity.
 - Such metrics are calculated from OTU frequencies.
 - Other metrics, e.g. unweighted UniFrac (called `unifrac_binary` in `usearch`) use presence / absence only, effectively considering a count to be one if it is any non-zero value.
- Predecir taxonomía de los OTUs (SINTAX)

Metagenómica

- USEARCH Paso E: Asignación taxonómica
- 19. Asignar taxonomía a los OTUs: `usearch -sintax`
- 20. Resumen de reporte de taxonomía a filo y genero: `usearch -sintax_summary`
- 21. Análisis estadístico con PAST3: generar PCoA o NMDS

Past 3.x - the Past of the Future

Past is free software for scientific data analysis, with functions for data manipulation, plotting, univariate and multivariate statistics, ecological analysis, time series and spatial analysis, morphometrics and stratigraphy.

Past went through a complete redesign in 2013.

Past works under Windows 7, Windows 10, and Mac OSX.

Current version (April 2019): **3.24**

Downloads

[Windows, zipped exe, version 3.24 \(5.5 MB\)](#)

[Mac, version 3.24 \(24 MB\)](#), only OSX 10.8 (Mountain Lion) and later

[PDF manual \(8 MB\)](#)

The old Past (version 2.17) with manual is still available, [here](#).

Moving pictures of the human microbiome

J Gregory Caporaso¹, Christian L Lauber², Elizabeth K Costello³, Donna Berg-Lyons², Antonio Gonzalez⁴, Jesse Stombaugh¹, Dan Knights⁴, Pawel Gajer⁵, Jacques Ravel⁵, Noah Fierer^{2,6}, Jeffrey I Gordon⁷ and Rob Knight^{1,8*}

Abstract

Background: Understanding the normal temporal variation in the human microbiome is critical to developing treatments for putative microbiome-related afflictions such as obesity, Crohn's disease, inflammatory bowel disease and malnutrition. Sequencing and computational technologies, however, have been a limiting factor in performing dense time series analysis of the human microbiome. Here, we present the largest human microbiota time series analysis to date, covering two individuals at four body sites over 396 timepoints.

Results: We find that despite stable differences between body sites and individuals, there is pronounced variability in an individual's microbiota across months, weeks and even days. Additionally, only a small fraction of the total taxa found within a single body site appear to be present across all time points, suggesting that no core temporal microbiome exists at high abundance (although some microbes may be present but drop below the detection threshold). Many more taxa appear to be persistent but non-permanent community members.
